System Architecture

Evidence-linked discrepancy detection across drawings, specifications, quantities, reviewer redlines and the BIM model

Rules first

Geometry, arithmetic, counts and cross-references are checked deterministically, with exact values and no AI.

AI only where judgment is needed

An optional language model compares specification wording with schedules. Its output is structured, quoted and capped at 'probable'.

No finding without evidence

Every finding cites the exact sheet location, spec paragraph, spreadsheet cell or model row, and each citation is re-verified in the source.

The engineer decides

Findings are potential discrepancies. Nothing is approved or published to the issue tracker without an engineer's acceptance.
